Access to this document does not grant any right or license on the document or its contents. This document or its contents are not to be used or treated in any manner inconsistent with the rights or interests of the FutureID Consortium or the Partners detriment and are not to be disclosed externally without prior written consent from the FutureID Partners.

Each FutureID Partner may use this document in conformity with the FutureID Consortium Grant Agreement provisions.

Abstract

In this document, we discuss the testing of the eSign Services (WP33) and their integration into the FutureID client. This document aims to provide input for the testing work package (WP37) and is split in three parts. The first part discusses how single components can be tested via unit tests. It, however, turns out that the eSign Services require quite some components from the remaining FutureID client architecture, e.g., SAL, IFD, Add-on framework and bindings. Thus, in the second part we discuss possible system tests and also provide concrete test vectors to ensure the successful integration of the eSign Services into the FutureID client. Finally, in the third part, we review the requirements defined in D33.1 and verify whether they are in line with the implementation.
