1. Abstract

This deliverable gives an overview of the developed first internal testbed. This testbed does not include tests for external components and therefore it's not intended to be distributed outside the consortium. The testbed consists of a virtual machine, which includes a tool for functional tests of server components as well as tools for system tests of client applications. However, this deliverable focuses on the SoapUI application which can be used inside the consortium to test different server components. The tools for system tests are seen as an additional tool to test whole authentication procedures including pin entry and other client related tasks. Further information about the system test tools can be obtained in work package WP37.
